**In the matter of exemption to prohibition on circumvention
of copyright protection systems for access control technologies**

Docket No. RM 2008-08

**Comments of the Electronic Frontier Foundation
in Support of Proposed Classes 5A, 5D, 11A
and of The Wireless Alliance, ReCellular and FlipSwap
in Support of Proposed Class 5D**

Submitted by:
Fred von Lohmann

fred@eff.org

Pursuant to the Notice of Inquiry of Exemption to Prohibition on Circumvention of Copyright Protection Systems for Access Control Technologies¹ (“NOI”), the Electronic Frontier Foundation (EFF) submits these reply comments on behalf of itself and, with respect to the portion of this reply comment discussing Proposed Class 5D, on behalf of The Wireless Alliance, ReCellular and FlipSwap, the original applicants for Class 5D.

These reply comments provide additional legal and factual support for each of the following proposed classes of works for which an exemption has been sought:

Proposed Class 5A: Computer programs that enable wireless telephone handsets to execute lawfully obtained software applications, where circumvention is accomplished for the sole purpose of enabling interoperability of such applications with computer programs on the telephone handset.

Proposed Class 5D: Computer programs in the form of firmware that enable wireless telephone handsets to connect to a wireless telephone communication network, when

¹ 73 Fed. Reg. 58083 (Oct. 6, 2008).

circumvention is accomplished for the sole purpose of lawfully connecting to a wireless telephone communication network, regardless of commercial motive.

Proposed Class 11A: Audiovisual works released on DVD, where circumvention is undertaken solely for the purpose of extracting clips for inclusion in noncommercial videos that do not infringe copyright.

I. Additional Support for Proposed Class 5A

Summary of Argument: EFF submits additional factual evidence in support of this proposed class in the form additional information about Apple's restrictions on independent iPhone application developers, additional technical information regarding the technologies used by smart phone vendors to restrict the applications that a smart phone owner can use, and a petition signed by 8,215 individuals who support the proposed class.

A. Apple Imposes Arbitrary, Anti-Competitive Restrictions on Independent iPhone Developers

EFF's original submission proposing class 5A included a discussion of the predicament faced by owners of Apple iPhones, who are restricted by the design of the iPhone to using only applications purchased from Apple's own iTunes App Store. As a result, independent iPhone developers must seek Apple's approval before they can sell applications to iPhone users. Simply put, Apple is using the restrictions built into the iPhone, not to protect any copyright interest in Apple's iPhone software, but rather to enforce a set of business model decisions that disserve iPhone owners and suppress competition from independent iPhone application vendors. Accordingly, there is no reason that 17 U.S.C. § 1201(a)(1) should provide legal protection to this Apple strategy.

The following reported incidents highlight the arbitrary and anti-competitive aspects of Apple's policies:

- Apple has blocked several applications (Podcaster², Mail Wrangler³) for "duplicating functionality" offered by Apple's own software. In the case of Podcaster, Apple subsequently deployed substantially identical functionality in its own iTunes application a few months later, demonstrating the anti-competitive nature of this policy.
- Although Apple has recently approved web browsers other than its own for use on the iPhone, all of them rely on Apple's own Webkit browser technology, leaving iPhone owners without access to competing browsers like Mozilla's Firefox and OmniWeb.⁴

² David Chartier, "Apple denies iPhone podcast app for 'duplicating iTunes,'" Ars Technica, Sept. 12, 2008, <<http://arstechnica.com/apple/news/2008/09/apple-denies-iphone-podcast-app-for-duplicating-itunes.ars>>.

³ Angelo DiNardi, "MailWrangler and the Apple App Store," Sept. 20, 2008, <<http://angelo.dinardi.name/2008/09/20/mailwrangler-and-the-apple-app-store/>>.

⁴ Sacha Segan, *The iPhone's Bogus "Alternative Browsers"*, PC Magazine, Jan. 27, 2009, <<http://www.pcmag.com/article2/0,2817,2339605,00.asp>>.

- Apple continues to bar applications that utilize “non-public APIs,” notwithstanding the fact that software from Apple and its favored partners (such as Google) are able to make use of these undocumented APIs.⁵
- Several ebooks have been banned from the App Store for content that Apple deemed “objectionable,” with at least one title being restored only after the author removed “dirty words” from his book.⁶
- Several applications have been removed for being “risqué,” while others have been permitted only after modifying their App Store marketing materials to meet Apple’s requirements.⁷ At the same time, other equally “off color” applications remain available without restriction.⁸
- Several applications, including Newber and iCall, remain in limbo, victims of unexplained delays in Apple’s “approval” process for the App Store.⁹
- After independent developers began developing software to enable “cut-and-paste” functionality on the iPhone, Apple revised the iPhone firmware to disable the application.¹⁰

These examples underscore the fact that there is no copyright-related rationale for preventing iPhone owners from “jailbreaking” their phones, enabling them to interoperate with applications lawfully obtained from a source of their own choosing. As the Copyright Office noted in 2006:

When application of the prohibition on circumvention of access controls would offer no apparent benefit to the author or copyright owner in relation to the work to which access is controlled, but simply offers a benefit to a third party who may use § 1201 to control the use of hardware which, as is increasingly the case, may be operated in part through the use of computer software or firmware, an exemption may well be warranted.¹¹

B. Technical Overview of Smart Phone Jailbreaking

In order to lend additional factual support to Proposed Class 5A, EFF has prepared a technical overview of the mechanisms used by phone providers and carriers to impose restrictions on phone owners, as well as a basic understanding of some of the most common methods used to defeat these protection measures. That overview is attached hereto as Appendix A.

This document provides further evidence that mobile phone vendors and network carriers are likely to argue that modifications that defeat restrictions on the kinds of applications that phone owners may run (“jailbreaking”) violate 17 U.S.C. § 1201(a)(1)’s prohibition on circumvention of technical protections measures used to control access to copyrighted works.

C. FreeYourPhone.org Petition

In January 2009, EFF created a web site, located at FreeYourPhone.org, in order to foster public awareness of proposed classes 5A and 5D, reasoning that many individuals have chafed under the restrictions imposed on mobile phones by both phone manufacturers and network carriers. Over the span of just a few weeks, 8,215 individuals signed an online petition supporting the proposed classes. The petition and complete list of signers is attached as Appendix B to these comments.

Dozens more individuals provided specific, individual stories regarding their personal experiences, illustrating ways in which these restrictions have stymied noninfringing uses of mobile phones and related firmware. Those stories will be submitted directly to the Copyright Office by the individuals and constitute precisely the “actual instances of verifiable problems” that the Copyright Office identified in the NOI as “the most compelling cases of actual harm.”¹²

This factual evidence demonstrates that a large number of individuals have an interest in “jailbreaking” their phones in order to run the software of their choice, thus supporting the conclusion that the application of 17 U.S.C. § 1201(a)(1) to the proposed class has a substantial adverse impact on noninfringing uses of the proposed class of works.

II. Additional Support for Proposed Class 5D

Summary of Argument: EFF, The Wireless Alliance, ReCellular and FlipSwap submit additional factual evidence in support of this proposed class in the form of additional technical information regarding the technologies used by smart phone vendors to implement “carrier locks” on mobile phones and a petition signed by ___ individuals who support the proposed class. The applicants also submit additional legal support for the proposed exemption, discussing further potential refinements to the scope of the proposed class in light of the applications by MetroPCS and Pocket Communications (Proposed Classes 5B and 5C).

A. Technical Overview of Smart Phone Unlocking

In order to lend additional factual support to Proposed Class 5D, EFF has prepared a technical overview of the mechanisms used by phone providers and carriers to impose restrictions on phone owners, as well as a basic understanding of some of the most common methods used to defeat these protection measures. That overview is attached hereto as Appendix A.

This document provides further evidence that mobile phone vendors and network carriers are likely to argue that modifications to defeat “carrier locks” (also known as “unlocking”) violate

¹² 73 Fed. Reg. at 58075.

17 U.S.C. § 1201(a)(1)'s prohibition on circumvention of technical protections measures used to control access to copyrighted works.

B. FreeYourPhone.org Petition

In January 2009, EFF created a web site, located at FreeYourPhone.org, in order to foster public awareness of proposed classes 5A and 5D, reasoning that many individuals have chafed under the restrictions imposed on mobile phones by both phone manufacturers and network carriers. Over the span of just a few weeks, 8,215 individuals signed an online petition supporting the proposed classes. The petition and complete list of signers is appended as Appendix B to these comments.

Dozens more individuals provided specific, individual stories regarding their personal experiences, illustrating ways in which these restrictions have stymied noninfringing uses of the phones and related firmware. Those stories will be submitted to the Copyright Office independently.

This factual evidence demonstrates that a large number of individuals have an interest in unlocking their phones in order to use them on a network of their choice, thus supporting the conclusion that the application of 17 U.S.C. § 1201(a)(1) to the proposed class has a substantial adverse impact on noninfringing uses of the proposed class of works.

C. Refinements to the Scope of the Proposed Class

At the close of the initial comment period in this rulemaking, MetroPCS and Pocket Communications separately proposed exemptions for classes of works in independent efforts to extend and improve the 2006 exemption for phone unlocking. There were some language differences between each of these two proposals and the proposals of the device recyclers and resellers represented in this rulemaking by EFF. Counsel for the recycler/resellers conferred with counsel for MetroPCS and for Pocket Communications about the language differences in an effort to understand whether there were substantive differences in the proposals and, if not, to craft a uniform proposed class to facilitate Copyright Office consideration of the proposals in this rulemaking.

There does not appear to be any substantive disagreement between commenters submitting Proposed Classes 5B, 5C, and 5D. EFF, The Wireless Alliance, ReCellular and FlipSwap therefore propose the following modified language to harmonize the proposals:

Computer programs that enable wireless communications devices to connect to wireless communications networks when circumvention is accomplished for the purpose of enabling such devices to lawfully connect to wireless communications networks.

This modification is offered for the reasons stated in MetroPCS's reply comment.

III. Additional Support for Proposed Class 11A

Summary of Argument: EFF submits additional factual evidence in support of this proposed class, demonstrating the continuing failure of CSS on DVDs to protect films nominated for 2009 Academy Awards. This further underscores that granting a narrow exemption for noncommercial video creators will not undermine the value of, or market for, copyrighted works released on DVD.

A. Further Evidence that CSS Does Not Protect the Value of, or Market For, Copyrighted Works on DVD

In weighing proposed exemptions to § 1201(a)(1), Congress instructed the Librarian to consider “the effect of circumvention of technological protection measures on the market for or value of copyrighted works.”¹³ As EFF pointed out in its comment proposing Class 11A, the major motion picture studios have previously opposed any DMCA exemptions for CSS-protected content released on DVDs, arguing that such an exemption would threaten to increase piracy and thus reduce their willingness to make films available on DVD.¹⁴ As explained more fully in EFF’s prior submission, this argument flies in the face of all available evidence. If the widespread, free availability of CSS circumvention tools since the 2003 rulemaking has not dampened Hollywood’s ardor for DVDs, authorizing remix video creators to circumvent CSS will hardly tip the scales.

One additional item of factual evidence underscores this point. Since 2003, independent journalist Andy Baio has been tracking the unauthorized availability of Oscar-nominated films as of the date of the Oscar nominations announcement.¹⁵ This year, the Academy of Motion Picture Arts and Sciences announced the Oscar nominees for 2009 on January 22. As of that date, 23 of the 26 films nominated were available in DVD quality via public peer-to-peer networks (25 of 26 were available, if camcorder versions were included in the tally). This figure is consistent with the availability numbers in previous years.¹⁶ And the data is even more vivid by the time Oscar night arrives in February: 148 out of 151 of Oscar-nominated films from 2003 to 2007 were available in DVD quality (sourced from either leaked retail or screener DVDs, both protected by CSS) by Oscar night.¹⁷ This data is just one more example demonstrating that CSS has not been a significant deterrent to digital infringement of DVD content for some time, and therefore cannot be understood to be protecting the market for, or value of, the content released on DVD.

As explained in EFF’s initial submission, major motion picture studios have continued to release an ever-increasing number of DVD titles, demonstrating that the weakness of CSS has not reduced the availability of copyrighted works on DVD. There is no reason to believe that approving an exemption for noninfringing, noncommercial video remix activities will alter these marketplace realities.

IV. Conclusion

For the reasons described herein, as well as the arguments presented in conjunction with the submission of the proposed classes discussed herein, EFF urges the Librarian of Congress to grant exemptions for proposed classes 5A, 5D, and 11A for the period 2009-2012. The Wireless Alliance, ReCellular and FlipSwap join in this request for proposed class 5D.

APPENDIX A

A Technical Overview of Smart Phone Jailbreaking and Unlocking

Seth Schoen, EFF Staff Technologist
Fred von Lohmann, EFF Senior Staff Attorney

I. Introduction

Modern cellular phones are increasingly sophisticated computing devices, capable of running applications from a variety of software vendors and operating on the networks of multiple carriers. Mobile phone providers and network operators, however, frequently use software locks to prevent mobile phone owners from installing applications of their choice or using their phones on the networks of competing carriers. Phone owners who want the freedom to run software or use the network of their choice have to “jailbreak” and “unlock” their phones in order to overcome these restrictions.

This submission supplements the submissions of EFF¹⁸ and the Wireless Alliance, Recellular, and Flipswap¹⁹ to the Copyright Office proposing exemptions from the strictures of the Digital Millennium Copyright Act (DMCA) for phone owners who want to jailbreak or unlock their phones. It is intended to provide a technical overview of the mechanisms used by phone providers and carriers to impose restrictions on phone owners, as well as a basic understanding of some of the most common methods used to defeat these protection measures.

II. Two Computers, One Handset: The Host and Baseband Systems

Modern cellular phones typically include two computers inside the same case: a *baseband system*, which controls the cell phone’s radio and communications with the cellular phone network, and a separate *host system* that manages user applications (such as the address book, web browser, games, media playback). The baseband and host systems generally have their own separate CPUs, memory, and operating systems, although they can communicate with one another (for instance, when the host system tells the baseband that the user wishes to make a phone call). Because the baseband and host systems are distinct, modifications of either system need not affect the other.

Carrier locks, when present, are normally implemented by the baseband system, whereas *application locks* and related restrictions are normally implemented by the host system. Because these restrictions are implemented in different systems, *unlocking* (defeating carrier restrictions, such as a policy that an iPhone sold in the United States may only be used with AT&T’s GSM service) and *jailbreaking* (defeating application restrictions, such as a policy that an iPhone can only run applications distributed through Apple’s iTunes App Store) are distinct technical activities, often relying on different techniques.

Many phone owners want to defeat carrier or application restrictions to make their phones more functional, useful, or secure against external threats. In all, over a million phone owners are

¹⁸ <<http://www.copyright.gov/1201/2008/comments/lohmann-fred.pdf>>

¹⁹ <<http://www.copyright.gov/1201/2008/comments/wireless-alliance.pdf>>

thought to have unlocked or jailbroken their phones, generally relying on tools and techniques derived from research and experimentation by informally organized hobbyist communities. In most cases, defeating the restrictions required finding some specific flaw (or “bug”) in the design of the phone, and then finding a way to take advantage of that flaw in order to defeat the restriction. The details of these design flaws vary widely—in some cases, inputting a “magic string” of characters frees the phone, while in others more sophisticated techniques are required.²⁰

III. Jailbreaking the iPhone: A Case Study

Apple’s iPhone, introduced in 2007, has become the best selling cellular phone handset in the United States.²¹ As such, it is also the most common example of a restricted cell-phone platform because of Apple’s policy—enforced by design features—that the phone may only run Apple-approved software.²² As a result, the iPhone has been subject to more widely publicized jailbreaking efforts than any other device. Researchers have discovered at least seven separate software features in various versions of the iPhone that may be used to circumvent Apple’s application restrictions.²³ Here we will discuss the most popular iPhone jailbreaking techniques.²⁴

As discussed above, the iPhone is comprised of two separate computers in one handset. The host system of the iPhone is built around the Samsung S5L8900 ARM CPU running a modified version of the Apple OS X operating system. The baseband system is built around an Infineon SGold CPU running the Mentor Graphics Nucleus real-time operating system.

The iPhone’s host system restricts users from running applications of their choosing. The heart of this restriction framework is a “chain of trust” built on cryptographic signature checking between software components. When an iPhone is turned on or rebooted, the host system loads a number of software components in a particular order:

- The process begins with the bootrom, software burned into the iPhone’s permanent, nonvolatile memory.
- The bootrom loads a piece of software called the LLB, which is stored in an area of memory known as NOR flash.

²⁰ Some of these design flaws can be fixed by phone vendors and carriers when they “update” the software used to operate the phones. Other flaws are more fundamental, and cannot be fixed without replacing the original hardware.

²¹ Joshua Topolsky, *iPhone 3G Overtakes the RAZR as Best-Selling Domestic Handset*, Engadget, Nov. 10, 2008, <<http://www.engadget.com/2008/11/10/iphone-3g-overtakes-the-razr-as-best-selling-domestic-handset/>>.

²² The operating system shipped on the iPhone checks for an Apple digital signature on each and every program before permitting it to run on the iPhone. This check is only one of several measures that make it difficult to add third-party software without Apple’s explicit approval.

²³ Much of this work has been done by a noncommercial, international group of hobbyists known as the “iPhone Dev Team,” which has developed and deployed the most popular unlocking and jailbreaking tools for the iPhone. See iPhone Dev Team blog, <<http://blog.iphone-dev.org/>>.

²⁴ Members of the iPhone Dev Team recently released a video that provides a detailed technical discussion of iPhone jailbreaking and unlocking techniques. See 25C3: Hacking the iPhone, <<http://video.google.com/videoplay?docid=713763707060529304>>.

- The LLB then loads a piece of software called iBoot, performing a digital signature check to ensure that iBoot software has not been modified.
- iBoot then loads the operating system kernel, performing a digital signature check to ensure that operating system software has not been modified.
- The operating system kernel then loads and manages all other “userland” applications (essentially, all the applications that users interact with), performing a digital signature check to ensure that the applications have been approved by Apple and have not been modified.

This chain of signature checks is meant to make it impossible for users to substitute their own software for Apple’s at any point in the process; even if they can somehow change the code installed on the phone, the signature checking is intended to prevent the modified software from running. And so long as the iPhone is running an unaltered version of Apple’s operating system, it will refuse to run any applications that have not been approved by Apple.

This “chain of trust” is, however, only as strong as its weakest link. In the iPhone, a signature check occurs at every stage *except the first one*—the bootrom does not check the signature of the LLB before loading it from the NOR flash.²⁵ Accordingly, if the phone owner is able to substitute a “patched” version of the LLB that does not do signature checking, the bootrom will load it without objection. This, in turn, allows the loading of “patched” versions of iBoot and the operating system kernel. These patched versions are generally identical to the original Apple code, except that they are willing to load and execute software without performing the signature checks that Apple intended to prevent the running of unauthorized software.

A group of hobbyists known as the iPhone Dev Team has developed software, known as Pwnage, that effectively enables an iPhone owner to replace Apple’s LLB, iBoot, and operating system kernel with “patched” versions that do not perform the signature checking.²⁶ This “patched” version of Apple’s software is created by each iPhone user on her own personal computer, using the Apple software that is licensed and distributed by Apple to every iPhone owner.

In addition to the signature checking mechanism described above, Apple also encrypts the iPhone operating system software and uses a digital signature to prevent it from being accessed or modified without authorization. Accordingly, in order to access the Apple software in order to

²⁵ Apple made a design assumption—apparently reasonable but ultimately incorrect—that only software created by Apple could ever be written to the NOR flash. Accordingly, although almost all code on the iPhone has a digital signature verified by some other code before it’s allowed to run, code that resides in the NOR flash is not checked. Various software bugs in Apple’s software, however, make it possible to write other software to the NOR flash memory, thereby defeating Apple’s “chain of trust” design.

²⁶ Because Pwnage takes advantage of the bootrom’s failure to do a signature check of the LLB, and because the bootrom is stored in permanent, nonvolatile memory, it appears that Apple cannot update the iPhones that have been sold so far (2G and 3G) to defeat the Pwnage software. Of course, future generations of iPhones could be modified by Apple to defeat this particular software tool.

create “patched” versions of the LLB, iBoot, and operating system kernel, the user must first decrypt the iPhone operating system software image.²⁷

We anticipate that Apple will argue that its “chain of trust” signature checking mechanism and practice of encrypting the iPhone operating system software constitute technical protection measures that control access to Apple’s iPhone operating system software within the meaning of 17 U.S.C. § 1201(a)(1). Accordingly, we expect that Apple would argue that jailbreaking an iPhone with any of the methods discussed here constitutes unlawful circumvention under 17 U.S.C. § 1201(a)(1).

IV. Unlocking the iPhone: A Case Study

As mentioned above, the baseband system on the iPhone is distinct from the host system, running on a separate CPU (Infineon SGold) and using a different operating system (Nucleus). The SIM carrier lock on the iPhone is implemented by the baseband system.²⁸

Thanks to an exclusive contractual arrangement between Apple and AT&T, all iPhones sold in the U.S. include a SIM carrier lock that prevent the phones from connecting to any cellular network other than AT&T’s. Absent this SIM carrier lock, the iPhone would operate on any compatible GSM network, including T-Mobile’s. Although Apple does not sell “unlocked” iPhones in the U.S., it does permit “unlocked” iPhones to be sold in more than a dozen other countries, including Italy, Belgium, Australia, and Hong Kong.²⁹ As a result of these policies, U.S. consumers are left worse off than their foreign counterparts.³⁰

The SIM carrier lock is enforced by the baseband system firmware on the iPhone. Utilizing unique identifiers burned into the baseband system’s Infineon SGold CPU and associated memory chips, the firmware establishes an area in memory known as the “seczone” where encrypted information about the SIM lock status is kept. The “seczone” contains policy information about which SIMs may be used with a particular phone, and related technical information. The only difference between iPhones tied to different carriers is the contents of this “seczone”—the firmware and hardware (other than the unique tokens burned into the SGold and associated memory chips) are identical across all same-model iPhones. In a manner similar to that used for the host system, Apple relies on a “chain of trust” between the baseband system’s bootrom, bootloader, and firmware, enforced by cryptographic signature checking, to prevent any unauthorized software from loading on baseband system, thereby preventing an iPhone owner from modifying the “seczone” carrier lock data.

²⁷ Early versions of Apple’s iPhone firmware image files were not encrypted. Current versions are encrypted, but the relevant keys have apparently been reverse engineered and widely circulated.

²⁸ The technical details of the iPhone SIM carrier lock are described by the iPhone Dev Team in their video, *see supra* n. 6.

²⁹ Apple publishes a list of countries in which the iPhone is available, including whether the phones are locked to a particular network provider. *See* <<http://support.apple.com/kb/HT1937>>.

³⁰ AT&T sells the iPhone at a subsidized price, but requires iPhone owners to enter into a two year minimum term agreement for cellular service. AT&T extracts a substantial early termination fee for those who withdraw from the agreement before its expiration. In other countries, consumers may choose between a locked iPhone sold at a subsidized price, or an unlocked iPhone at an unsubsidized price.

Despite this design, both the “first generation” 2G iPhone and the “second generation” 3G iPhone can currently be “unlocked” by their owners using widely available and relatively easy-to-use software.³¹ The most popular software for this purpose is Pwnage (for the 2G iPhone) and yellowsn0w (for the 3G iPhone).³² However, because the restriction framework used in the 2G iPhone differs from that used in the 3G iPhone, the corresponding unlocking techniques are different.

For the 2G iPhone, one unlocks the device in a manner similar to the jailbreaking process described earlier—the user installs a “patched” version of Apple’s baseband firmware that does not enforce the SIM carrier lock. This is possible because the bootrom in the baseband system does not perform a signature check on the bootloader before loading it. The Pwnage tool substitutes a “patched” version of the bootloader when the phone is turned on, which in turn loads a “patched” version of Apple’s baseband firmware that suppresses the SIM carrier lock.

For the 3G iPhone, Apple improved the “chain of trust” in the baseband system, re-engineering it to require that the bootrom perform a signature check on the bootloader before loading it. Accordingly, it is more difficult to substitute a “patched” version of the baseband firmware in place of the unaltered version. Nevertheless, an owner of a 3G iPhone can currently unlock it using an application known as yellowsn0w, which “injects” software into baseband system memory while the firmware is operating (i.e., “on-the-fly code injection”), thereby suppressing the operation of the SIM carrier lock.³³

In light of the mechanisms Apple has deployed to lock the iPhone to the AT&T cellular network, we anticipate that Apple will argue that the use of software like Pwnage or yellowsn0w by an iPhone user to unlock her phone constitutes a circumvention of a technical protection measure in violation of 17 U.S.C. § 1201(a)(1).

V. Administrative Privileges on the G1: A Case Study

The HTC Dream smart phone, released by T-Mobile in the United States in 2008 as the G1, is the first phone to be sold preloaded with Google’s new open-source Android phone operating system.³⁴ Android is based on Linux and was developed by Google as part of the Open Handset Alliance.³⁵ Although the Android open source license permits users to modify the operating system

³¹ This is sometimes called a “software unlock” by the iPhone user community, to distinguish it from a “hardware unlock,” where the iPhone is disassembled and a new baseband chip installed.

³² Both of these were developed by the iPhone Dev Team and are freely distributed using BitTorrent. See Dev-Team Blog, <<http://blog.iphone-dev.org/>>.

³³ This technique requires that the 3G iPhone first be jailbroken, presumably because the relevant software is first installed on the host system, then moved to the baseband system. Apple has recently issued a new version of the iPhone baseband firmware (v. 2.2.1) that yellowsn0w does not currently unlock, although the Dev Team is reportedly working on revising their software in response. See “Close the Stable Door,” Dev-Team Blog, <<http://blog.iphone-dev.org/post/74278878/close-the-stable-door>>.

³⁴ See <<http://www.t-mobileg1.com/>>.

³⁵ See <<http://code.google.com/android/>> (describing the Android operating system, documenting it for software developers, and making available its source code for download under an open source license) and <<http://www.openhandsetalliance.com/>> (describing the Open Handset Alliance, a consortium of 47 technology firms interested in developing telephones, software, and services that work with Android).

itself, T-Mobile designed its G1 to provide no means for G1 owners to obtain administrative access on the phone. Although applications can be installed, the operating system cannot be modified, and some functionality requiring administrative access is unavailable.³⁶

For example, administrative access is required to enable the use of the multi-touch functionality on the G1 display, enabling more sophisticated user interfaces.³⁷ Administrative access is also currently required in order to “tether” the phone to a laptop, providing direct Internet access to the laptop over the cellular network, and for other purposes such as making a low-level backup of all the data stored on the phone. Administrative access also provides more full-featured support for the Bluetooth wireless interface built into the G1. In general, administrative access is important for adding functionality that could be supported by the phone’s hardware but that cannot be accessed through the documented Android programming interfaces.

Although T-Mobile did not provide users with an official way of obtaining administrative access, G1 users discovered that T-Mobile had inadvertently left the G1 configured so that text typed on the G1’s keyboard could simultaneously be run (invisibly) as a Unix command with full administrative privileges. Thus, typing an appropriate command could start a network server that could then be used to connect to the G1 and run other commands, including commands that modify the operating system in ways unsupported by T-Mobile. This process is usually referred to as *rooting* the G1, a reference to the fact that the administrative account on a Unix system is called the *root account*.

The current Android release distributed as a firmware image by T-Mobile fixes this flaw. Users, however, discovered that they can “downgrade” the firmware to an earlier version and thereby re-introduce the flaw, even though T-Mobile included signature checking features intended to allow only firmware upgrades and not downgrades.³⁸

It is unclear whether T-Mobile would argue that gaining administrative access to the G1 using this keyboard flaw constitutes a violation of 17 U.S.C. § 1201(a)(1). Nevertheless, T-Mobile’s update to the G1 firmware to block this technique, in addition to code that attempts to prevent users from downgrading to older firmware versions, suggests that T-Mobile may take additional steps to prevent users from having administrative access on future versions of the G1 phone. T-Mobile may also argue that technical measures to prevent firmware downgrades effectively control access to copyrighted firmware images, or that the denial of administrative access itself controls access to portions of the copyrighted software on the phone.

Moreover, like Apple, T-Mobile can make future hardware revisions to the G1 that would prevent users from using known techniques to obtain administrative access. Users would then need

³⁶ Google has begun selling “unlocked” versions of the G1 phone that provide root access to their owners, demonstrating that there is no technical reason that a G1 owner should not have administrative privileges. See <<http://code.google.com/android/dev-devices.html>> (selling an Android-compatible phone substantially identical to the G1 that works with any GSM network operator and that provides the owner with administrative access in a documented way).

³⁷ See Luke Hutchinson, “Zoom-Zoom-Zoom – Get Multitouch Zooming Support on Your T-Mobile G1 Today,” <<http://lukehutch.wordpress.com/2009/01/25/get-multi-touch-support-on-your-t-mobile-g1-today/>>.

³⁸ See “Rooting G1 from RC30 version,” Android Community Social Network, <<http://androidcommunity.com/forums/blog.php?b=147>>.

to discover, and apply, new techniques in order to obtain administrative access on their G1 phones.³⁹ Accordingly, it is reasonable to assume that G1 owners over the next three years would benefit from the grant of an exemption to dispel any legal doubts arising from the application of 17 U.S.C. § 1201(a)(1) to future efforts to gain administrative access to the T-Mobile Android phones they purchase.⁴⁰

VI. Conclusion

The foregoing discussion demonstrates that phone vendors and carriers utilize a variety of technical measures to restrict what networks a phone's owner may use, and what applications she may run. In light of these technical measures, it is likely that during the next three years, these vendors and carriers will argue that unlocking or jailbreaking of these phones would, absent an exemption granted in this rule-making, violate 17 U.S.C. §1201(a)(1)'s ban on circumvention. In light of this risk, and for the reasons set forth in the previous submissions by EFF and The Wireless Alliance et al., we urge the Library of Congress to grant proposed exemption classes 5A and 5D.

³⁹ A community of G1 owners and hobbyists akin to the community surrounding the iPhone is, in fact, already actively engaged in finding, documenting, and applying these techniques.

⁴⁰ Although it might appear that the open-source licensing of Android would make such claims less likely, the default versions of the G1 firmware provided by T-Mobile contain some software components that are not open source and are not licensed under the same terms as the operating system as a whole.

APPENDIX B

FREEYOURPHONE.ORG

Cellphone manufacturers use locked software to stifle competition and restrict consumers:

* Apple uses software locks on the iPhone to censor ebooks and block mobile applications that would compete with Apple's own software.

* T-Mobile's software locks prevent owners from gaining root access to the Google Android G1 phone, needlessly limiting the phone's bluetooth and other capabilities.

* And virtually every mobile device sold today is locked to a single telecommunications carrier. Hundreds of thousands of cellphone owners have modified their phones to connect to the network or run the software of their choosing, and many more would like to. But the Digital Millennium Copyright Act poses a legal threat to phone users, even though the law was supposed to protect copyright owners and distributors of digital music and movies. This threat of litigation has driven consumers underground, stifling innovation and competition.

Now, you can support EFF's request that the Copyright Office grant an exemption to the DMCA that will protect phone users. Sign below to add your name to EFF's request to the copyright office. Then, on the next page, you can share a story about how these restrictions have affected you personally.
