### **ABSTRACT**

Monitor the FUV detector dark rate by taking long science exposures without illuminating the detector. The detector dark rate and spatial distribution of counts will be compared to pre-launch and SMOV data in order to verify the nominal operation of the detector. Variations of count rate as a function of orbital position will be analyzed to find dependence of dark rate on proximity to the SAA. Dependence of dark rate as function of time will also be tracked.

### **OBSERVING DESCRIPTION**

Monitor the FUV detector dark rate by taking TIME-TAG science exposures with no light on the detector. Five times a week a 22-min exposure is taken with the FUV detector with the shutter closed. The length of the exposures is chosen to make them fit in Earth occultations.

### **ADDITIONAL COMMENTS**

As to scheduling the individual visits, experience with STIS showed that UV detector temperatures systematically increase while the detector is turned on, and decreases when it is turned off. Hence, some effort should be made to ensure that the darks are distributed over the daily cycle of FUV

detector operations, i.e., that they don't tend to systematically clump together just after turnon or just before turnoff.
