**ABSTRACT**

We propose a wide field pure-parallel survey of emission-line galaxies spanning a wide range of cosmic time  $1 < z < 8$ , with the NIRISS grism, unbiased with respect to cosmic variance or photometric pre-selection.

With the suite of rest-frame optical emission lines detected, we will measure spatially resolved extinction-corrected star formation rates, gas ionization properties, and metallicities across “Cosmic Noon” ( $z=1-3.5$ ), reaching down to stellar masses of  $1e7 M_{\text{sun}}$ , enabling key tests of theoretical models at 0.5 kpc resolution. At  $z > 7$  we will spectroscopically discover many dozens of the brightest Ly-alpha line emitters in the reionization epoch, and also detect Ly-break galaxies independent of their Ly-alpha lines. This will provide the first unbiased determination of the EW(Ly-a) distribution, and potentially evidence for ionized bubbles. We will also obtain stellar abundances in bright galaxies, and a census of brown dwarfs deep into the Galactic halo.

We expect to observe 80 shallow fields, 33 medium and 11 deep independent fields at high galactic latitudes, detecting several thousand galaxies (with line SNR  $> 5$ ) reaching star formation rates (SFRs) down to  $< 1 M_{\text{sun}}/\text{yr}$ . Wide and continuous spectral coverage (1.0-2.2 $\mu\text{m}$ ) will secure rest-frame optical emission line ratios in the medium/deep fields. The all-sky coverage will remove cosmic variance, and uncover rare bright galaxies for follow up opportunities.

To maximize benefit to the community and JWST follow-up opportunities, we will rapidly release fully-reduced spectra and images in user-friendly formats, as well as catalogs of redshifts, SFRs, reddenings, metallicities, and 2-D maps of resolved line emission.

### **OBSERVING DESCRIPTION**

We will use NIRISS in grism spectroscopy mode to obtain unbiased spectroscopic surveys of galaxies across the full range of redshifts, in over 100 independent fields.

Based on the pure parallel opportunities from GTO programs, we have conservatively planned for this combination of pure parallels in Cycle 1:

Length(hrs) # of Fields Cumulative Hrs

2.....	40.....	80
3.....	25.....	75
4.....	15.....	60
5.....	10.....	50
6 .....	8.....	48
7 .....	6.....	42
8 .....	5.....	40
9 .....	4.....	36
12.....	5.....	60
15.....	4.....	60
20.....	2.....	40
.....	124.....	591

For the shorter fields, we will obtain 2.0um spectroscopy (with the necessary supporting F200W direct imaging). This is a highly efficient method for picking out bright emission line galaxies at higher redshifts than have previously been probed. For the medium and longer fields, we will obtain wide spectral coverage with the F115W, F150W and F200W bandpasses. The integration times in the bluest setting will be tripled to compensate for the fainter fluxes of lines we expect to observe at those wavelengths. All grism observations are done immediately after corresponding deep direct imaging has been obtained of the same location with the same broadband filter.
